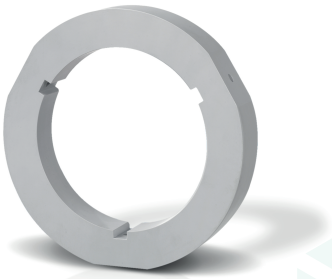
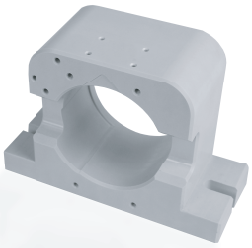
PET

ERTALYTE® TX

Semi-crystalline plastic, is a material that contains a solid lubricant dispersed uniformly. Its specific formulation produces internal lubrication.
It is particularly recommended for bearings and parts with friction movement.
It offers higher wear resistance, lower coefficient of friction and higher PV values than normal ERTALYTE®.





MAIN CHARACTERISTICS

- Exceptional wear resistance (higher than Ertalyte®)
- Lower and more uniform coefficient of friction
- It stands out in high pressure and high-speed situations
- Self-lubricating composition, therefore less sensitive to the "stick-slip" effect
- Physiologically inert
- Very low thermal expansion
- Very low moisture absorption

APPLICATIONS

- Bushings with high speeds
- Guides
- Wear parts with heavy loads

NOTE: 1 g/cm³ = 1000 kg/m³ ; 1 MPa = 1 N/mm² ; 1 KV/mm = 1 MV/m

+: values for dry material
++: values referring to material in equilibrium with the standard atmosphere 23°C / 50% rh

(1) According to method 1 of ISO 62 and measured on ø 50x3 mm discs. **(2)** The elements supplied for this property are for the most part supplied by the manufacturers of the raw materials. **(3)** The values of this property are only attributed to amorphous rather than semi-crystalline materials. **(4)** Only for short periods of exposure in applications where only very low loads are applied to the material. **(5)** Temperature that resists after a period of 5,000 / 20,000 hours. After this time, there is a decrease of about 50% in tensile strength compared to the original value. The given temperature values are based on the thermal oxidation degradation which occurs which causes a reduction of the properties. In the meantime, the maximum permissible service temperature depends in many cases essentially on the deduction and magnitude of the mechanical stresses to which the material is subject. **(6)** As the impact strength decreases with decreasing temperature, the minimum allowable service temperature is determined by the extent of impact to which the material is subjected. The values given are based on unfavorable impact conditions and can not therefore be considered absolute limits.
(7) These assessments derive from the technical specifications of the manufacturers of the raw materials and do not allow the determination of the behavior of the materials under fire conditions. **(8)** Most of the figures given by the properties of the (+) materials are mean values of the tests done on species machined with ø 40-60 mm. **(9)** Specimen testing: Type 1b. **(10)** Speed test: 5 or 50 mm / min. **(11)** Speed test: 1m / min. **(12)** Testing specimens: cylinders ø 8 x 16 mm. **(13)** Pendulum used: 15J. **(14)** Test on 10 mm thick specimens. **(15)** Electrode configuration: cylinders ø 25 / ø 75 mm, in transformer oil according to IEC 60296.

Note that the electrical force for the extruded black material can be considerably
lower than that of natural material. The possible micro porosity in the center of conserved forms in stock significantly reduces the electric force.
